

Ventia – EastLink Tunnel

Ventilation Stack Air Quality Monitoring Validated Data Report

01 July 2024 to 30 September 2024

Ref: DR.2024Q3.ETL

Issue Date: 28 October 2024

Report prepared by: Tim Allfrey

NATA Accredited Laboratory Number 19660

Accredited for compliance with ISO/IEC17025 – Testing

The results of the tests, calibrations and/or measurements included in this document are traceable to Australian / national standards.

Norditech Pty Ltd

Unit 2/87 Station Road Seven Hills NSW 2147

1 Executive Summary

EastLink is a 39 km motorway running between Nunawading and Frankston, linking the Eastern, Monash Frankston and Peninsula Link freeways. Two 1.6 km tunnels pass under the Mullum Mullum Valley, with a ventilation stack at the end of each tunnel as an exit point for tunnel ventilation.

Two ventilation stacks provide ventilation for the tunnel, one at the western end of the tunnel at Discharge Point 1 (DP1), and one at the eastern end of the tunnel at Discharge Point 2 (DP2).

This report presents the monthly validated stack data for July 2024 to September 2024 to Ventia Pty Ltd for the EastLink Tunnel.

1.1 Compliance to limits

The Environment Protection Authority (Victoria) designates limits to which pollutant mass rates being discharged from the ventilation stacks must meet. (Environmental Licence No. 2043).

Instances of the ventilation stack pollutants exceeding the EPA Limits goals during the reporting period are presented in Table 1, Table 2 and Table 3 and below. Maximum mass rates are provided for comparison to the limits.

There were two exceedances of the prescribed limits during the reporting period.

	EastLink Ventiliation Stack Air Quality Limit Exceedances July 2024

Table 6: September 2024 Summary of results

2 Compliance Limits

Air quality limits are provided in Condition LI_DA1.13 of the Environment Protection Authority (Victoria) Licence No 2043 for the EastLink Tunnel. The air quality limits for 1-hour mass rates are shown in Table 7 below.

EastLink Ventiliation Stack Air Quality Limits											
Location	Parameter	Time Period	Units	Applicable Licence							
	NO_2	1-hour	3.98	kg/h							
Western Ventilation Stack	со	1-hour	112	kg/h	EPA Vic						
(Discharge Point 1)	PM _{2.5}	1-hour	2.4	kg/h	Licence No 2043						
·	PM ₁₀	1-hour	2.6	kg/h							
	NO ₂	1-hour	3.98	kg/h							
Eastern Ventilation Stack	СО	1-hour	112	kg/h	EPA Vic						
(Discharge Point 2)	PM _{2.5}	1-hour	2.4	kg/h	Licence No 2043						
	PM ₁₀	1-hour	2.6	kg/h							

Table 7: EPA Compliance Limits

The procedure for reporting particulate matter results from the TEOMs and assessment of licence compliance is detailed in the EastLink Particulate Matter Protocol (PMP) dated 17/06/2013. The PMP requires validated uncorrected TEOM one hour clock average data to be compared to the following TEOM mass rate compliance limits for both DP1 and DP2.

PM_{2.5}: 2.0 kg/h
PM₁₀: 2.0 kg/h

2.1 Standards Compliance

Norditech's NATA Accreditation does not cover the following parameters monitored at the EastLink Tunnel ventilation stack air quality monitoring stations.

- Measurement of Stack Flow.
- AS/NZS 3580.9.8 refers specifically to the monitoring of PM₁₀.

EastLink Ventilation Stack Air Quality Monitoring Validated Report

July 2024 to September 2024 Reference: DR.2024Q3.ETL

Issued: 28-Oct-24

3 Introduction

Norditech were contracted by Ventia Pty Ltd in August 2021 to provide continuous stack air quality monitoring and reporting services for the EastLink Tunnel. Ventia Pty Ltd are responsible for the operation and maintenance of the motorway.

Norditech is a NATA accredited organisation (Accreditation Number 19660).

Addresses of relevant parties:

Norditech Pty Ltd 2/87 Station Rd Seven Hills NSW 2147 Ventia Pty Ltd 2 Hillcrest Avenue Ringwood VIC 3134

This report presents the validated Western and Eastern ventilation stack data for July 2024 to September 2024.

- Describes air quality measurements.
- Reports any readings above the relevant EPA Limits.
- Compares monitoring results.
- Has been quality assured.

4 Explanation of Monitoring

4.1 Methodology

In the tunnel air is discharged via two ventilation stacks – one located at the Western end of the tunnel (DP1), and one located at the Eastern end (DP2). For each stack, monitoring as per the requirements of EPA Licence 2043 is undertaken.

Gaseous parameters are sampled by an extractive sampling system. Oxides of nitrogen are measured using chemiluminescence. Carbon monoxide is measured using non-dispersive infra-red absorption.

Particulates PM₁₀ and PM_{2.5} are measured using tapered element oscillating microbalances.

Stack gas velocity is measured using an optical flow sensor.

Monthly routine maintenance is undertaken by Norditech. Maintenance is performed as per the relevant Australian Standard or in house method. Maintenance cycles generally involve 1, 3, 6 and 12 monthly scheduled items.

The following instrumentation and methods are used in data collection:

EastLink Ventilation Stack Measurement Methods							
Parameter	Method	Instrument					
СО	In house method TP.003	Thermo Scientific 48i					
NO, NO ₂ , NO _x	In house method TP.001	Thermo Scientific 42i					
	AS/NZS 3580.9.8						
PM ₁₀	In house method TP.005	Rupprecht & Patashnick TEOM					
	AS 4323.1						
D14	In house method TP.026	Down and the Control of TECOM					
PM _{2.5}	AS 4323.1	Rupprecht & Patashnick TEOM					
Temperature	In house method TP.012	PT100					
Stack Velocity	USEAP (CFR 40) Part 75	OSI OFS2000					

Table 8: Measurement methods and instrumentation

4.2 Ventilation Stacks

The locations of the EastLink Tunnel Western and Eastern ventilation stacks are detailed in Table 9 and Figure 1 below.

EastLink Ventilation Stack Locations						
Discharge Point	Site Name	GPS Coordinates				
1	Western Ventilation Stack	-37.801229°, 145.196092°				
2	Eastern Ventilation Stack	-37.808885°, 145.212012°				

Table 9: EastLink Tunnel ventilation stack GPS Coordinates

Figure 1: EastLink Tunnel ventilation stack locations

EastLink Ventilation Stack Air Quality Monitoring Validated Report July 2024 to September 2024

Reference: DR.2024Q3.ETL

Issued: 28-Oct-24

4.3 Data Collection

At each Air Quality Monitoring Station, data is logged to an EnviDAS data logger at 1 minute average intervals. Each 1-minute average is calculated from data sampled at 10 second intervals.

Data is transferred automatically to Norditech's data collection software via a TCP/IP link over 4G cellular network, at a frequency of not less than 1-hour. Two datasets are maintained by Norditech, one for data validation and reporting purposes, and a non-validated data set for reference purposes.

4.4 Data Validation

Data validation is performed as per Norditech's data validation procedure TP.022. The data validation process identifies any data that is deemed not to be valid. This data is flagged as invalid in the database and is removed from the reported data.

Data may be deemed invalid for several reasons, including but not limited to:

- Instrument fault.
- Instrument calibration out of tolerance.
- Maintenance activities.

For further details and explanations of reasons for invalidating data, please refer to Appendix 1 – Data Validation Explanations.

Initial visual inspection of data is performed by inspection of graphs to identify any anomalies in the data set.

Site visit logs and maintenance and calibration certificates are cross referenced to the data set and any data affected by maintenance activities are flagged.

Instrument drift and calibration tolerances are checked, and data flagged in the database as necessary as per NATA compliance requirements.

4.5 Reporting and Calculations

All calculations and averages are calculated from 1 minute average base data and are reported as 'end time' when the averaging periods of eight hours or less. IE the average data for 01:00 is the data from 00:00 through to 01:00. One-hour averages are calculated based on a clock hour. One day averages are calculated based on calendar days. All averages are based on a minimum of 75% valid readings within the averaging period.

All data is reported at Australian Eastern Standard Time.

Validated data for Quarter 2 Month 1 is presented in the Excel workbook named "202407 EastLink Q3M1 Validated data.xlsx"

The workbooks each consist of the following sheets:

Sheet 1: Cover

Sheet 2: M1 Data kg1h - Hourly data in kg/h

Sheet 3: M1 Data g5m – 5-minute data in grams/5m

Sheet 4: M1 Data mgm3 1h – 1-hour data in mg/m³

Sheet 5: M1 Data mgm3 5m – 5-minute data in mg/m³

Sheet 6: Eastern Validation Data

Sheet 7: Western Validation Data

Validated data for Quarter 2 Month 2 is presented in the Excel workbook named "202408 EastLink Q3M2 Validated data.xlsx"

The workbooks each consist of the following sheets:

Sheet 1: Cover

Sheet 2: M2 Data kg1h - Hourly data in kg/h

Sheet 3: M2 Data g5m – 5-minute data in grams/5m

Sheet 4: M2 Data mgm3 1h – 1-hour data in mg/m³

Sheet 5: M2 Data mgm3 5m - 5-minute data in mg/m³

Sheet 6: Eastern Validation Data

Sheet 7: Western Validation Data

Validated data for Quarter 2 Month 3 is presented in the Excel workbook named "202409 EastLink Q3M3 Validated data.xlsx"

The workbook consists of the following sheets:

Sheet 1: Cover

Sheet 2: M3 Data kg1h – Hourly data in kg/h

Sheet 3: M3 Data g5m – 5-minute data in grams/5m

Sheet 4: M3 Data mgm3 1h – 1-hour data in mg/m³

Sheet 5: M3 Data mgm3 5m - 5-minute data in mg/m³

Sheet 6: Eastern Validation Data

Sheet 7: Western Validation Data

Issued: 28-Oct-24

4.5.1 Data Availability

Data availability refers to the amount of available 1-hour data for the reporting period. Data availability is calculated using the following formula:

Data availability
$$\% = \frac{sum\ of\ available\ data\ points}{sum\ of\ possible\ data\ points} * 100$$

Where:

- Sum of available data points is the number of validated 1-hour average data points for the reporting period.
- Sum of possible data points is the number of theoretically available 1-hour data points for the reporting period.

4.5.2 Unit Conversions

Stack velocity readings are converted to flow rate using the following stack areas:

- Western Stack area 35 m²
- Eastern Stack area 35 m²

Pollutant and flow data are reported at actual conditions.

Issued: 28-Oct-24

5 Calibrations and Maintenance

5.1 Units and Uncertainties

EastLink Ventilation Stack Instrument Units and Uncertainties								
Parameter	Parameter Units F		Uncertainty	Measurement Range				
СО	mg/m³	0.01	± 8.2% of reading at 62.5mg/m ³ (k=1.96)	0 to 200				
NO	mg/m³	0.01	± 8.1% of reading for range 25.7 – 32.8mg/m³ (k=1.96)	0 to 150				
NO ₂	mg/m³	0.01	± 8.5% of reading at 25.7mg/m ³ (k=1.96)	0 to 150				
NO _x	mg/m³	0.01	± 8.1% of reading for range 25.7 – 32.8mg/m³ (k=1.96)	0 to 150				
PM ₁₀	μg/m³	0.1	±5.0 µg/m ³ or 3.6% of reading, whichever is the greater. K factor of 1.96	0 to 5000				
PM _{2.5}	μg/m³	0.1	±5.0 µg/m³ or 3.6% of reading, whichever is the greater. K factor of 1.96	0 to 5000				
Temperature	°C	0.1	±2.0 °C ¹	-25 to 105				
Stack Velocity	m/s	1	±0.1 m/s ¹	-40 to +40				

Manufacturer's stated accuracy

Table 10: Measurement units and uncertainties

5.2 Last Calibrations and Maintenance records

Instrumentation maintenance and last calibration dates are provided in Table 11, Table 12 and Table 13 below:

EastLink Ventilation Stack Maintenance and Calibrations July 2024

This table details any missing data, data removed due to being deemed invalid, or data that has been adjusted.

Table 29: September 2024 Eastern Ventilation Stack data validation

July 2024 to September 2024 Reference: DR.2024Q3.ETL

Issued: 28-Oct-24

6.4 Data Availability Year to Date

Data availability statistics for year to date (01 January 2024 to 30 September 2024) are provided in Table 30 below:

EastLink Ventilation Stack Data Availability January 2024 to September 2024								
Station	NO	NO ₂	со	PM _{2.5}	PM ₁₀	Stack Velocity	Stack Temp.	
Western	94.4%	94.4%	95.2%	92.2%	97.8%	100.0%	99.9%	
Eastern	94.8%	94.8%	95.2%	97.9%	95.4%	99.9%	97.9%	

Table 30: EastLink Ventilation Stack year to date data availability

Issued: 28-Oct-24

6.5 Annual Performance Statement Bubble Limits

The EPA License 2043 Condition LI_DA1 designates annual emission rate bubble limits for discharge points 1 and 2. Annual emission rates are calculated from 1st July to 30th June each year to coincide with the Annual Performance Statement (APS) reporting period. Ventilation Stack emission rates year to date (01 July 2024 to 30 September 2024) are shown in Table 31 below.

EastLink Ventilation Stack Mass Rate July 2024 to September 2024							
Location	NO ₂	СО	PM _{2.5}	PM ₁₀			
Location	Tonnes	Tonnes	Tonnes	Tonnes			
Western Ventilation Stack (Discharge Point 1)	0.197	3.344	0.053	0.113			
Eastern Ventilation Stack (Discharge Point 2)	0.301	2.924	0.065	0.170			
Total	0.498	6.268	0.118	0.283			
Percentage of Licence limit	1.4%	0.6%	0.6%	1.2%			
Annual Limit (Tonnes)	35	980	21	23			

Table 31: Annual Performance Statement stack emission rates

Figure 23 below presents the ventilation stack emissions of each parameter as a percentage of the Licence limit compared with the percentage of elapse APS Reporting period.

EastLink Ventilation Stack Air Quality Monitoring Validated Report

July 2024 to September 2024 Reference: DR.2024Q3.ETL

Issued: 28-Oct-24

7 Report Summary

• There were two exceedances of the prescribed limits during the reporting period.

Appendix 1

Glossary

The following terms and abbreviations are used in this report

CO Carbon monoxide
DP1 Discharge Point 1
DP2 Discharge Point 2
kg/hour Kilograms per hour
g/5m Grams per 5 minutes
m³/s Cubic meters per second

mg/m³ Milligrams per cubic meter at dry, standard temperature and pressure (0°C and 101.3 kPa)

NO Nitric oxide NO₂ Nitrogen dioxide

PM₁₀ Particulate less than 10 microns in equivalent aerodynamic diameter PM_{2.5} Particulate less than 2.5 microns in equivalent aerodynamic diameter

Data Validation Explanations

Automatic background check refers to when analyser samples zero air and measures the level of the concentration voltage. This voltage is taken as the zero signal level and this value is subtracted from any subsequent readings as an active zero compensation. This is the analyser's fine zero measurement.

Calibration check outside tolerance refers to when the calibration values are outside the tolerance limits set for the precision check.

Offset or Multiplier Applied to data refers to an offset or multiplier applied to the data. This operation may be performed for a number of reasons including: (a) when a clear trend / drift outside the tolerance limit can be demonstrated by repeated operation precision checks, (b) when a correction is required on previously logged data due to a calibration check being outside the allowable tolerance

Data transmission error refers to a period of time when the instrument could not transmit data. This may be due to a communication fault between the logger and instrument.

Equipment malfunction/instrument fault refers to a period of time when the instrument was not in the normal operating mode and did not measure a representative value of the existing conditions.

Missing data/data not available refers to a period of time when either data has been lost or could not be collected.

Instrument Alarm refers to an alarm produced by the instrument. A range of alarms can be produced depending on how operation of the instrument is being affected.

Instrument out of service refers to an unavailability of data due to an instrument being shut down for repair, maintenance, or factory calibration.

EastLink Ventilation Stack Air Quality Monitoring Validated Report

July 2024 to September 2024 Reference: DR.2024Q3.ETL

Issued: 28-Oct-24

Logger error refers to when an error occurs and instrument readings are not correctly recorded by the logger.

Maintenance refers to a period of time when the logger / instrument was unavailable due to maintenance.

Overnight span/zero out of tolerance refers to when the span/zero reading measured by the analyser during an automatic precision check falls outside of the expected concentration limits.

Power Interruption refers to no power to the station therefore no data was collected at this time.

Remote Calibration refers to when a technician remotely connects to the station and manually performs a span check.

Warm up after power interruption refers to the start up period of an instrument after power has been restored.
